

Cinema Management System

PROBLEM STATEMENT

Manual cinema ticketing processes are inefficient and prone to errors such as double-booking seats, delays in customer service, and inaccurate bill management. This project delivers a lightweight, reliable CLI application that automates movie browsing, seat reservations, and total cost calculations in real-time.

SCOPE OF THE PROJECT

- **Interactive Navigation:** Simple menu-driven interface for seamlessly executing operational tasks.
- **Movie Catalog Display:** Shows up-to-date schedules for active screenings.
- **Seat Reservation Engine:** Real-time status mapping across 10 seats with built-in duplicate booking protection.
- **Automated Billing:** Instant calculation of ticket counts and total charges (fixed rate of ₹350 per ticket).

TARGET USERS

Cinema Desk Agents

Front-desk staff requiring a fast, simplified tool to reserve seats and produce ticket totals for customers.

Developers & Students

Learners looking for a modular Python project demonstration covering loops, list manipulation, and functions.

HIGH-LEVEL FEATURES

- **Movie Catalog (`movies.py`):** Displays scheduled movies including *Train to Busan*, *Dhurandar*, *Pushpa*, and *KGF*.
- **Seat Status & Booking (`booking.py`):** Monitors available vs. reserved seats and enforces single/multi-seat reservation checks.
- **Automated Billing (`billing.py`):** Computes price tallies based on ticket volume and renders itemized summary receipts.
- **Central Interface (`main.py`):** Handles routing and user inputs in a continuous console session loop.
